Introduction

A core ambition of the Sustainable Development Goals (SDGs)—the economic, social, and environmental objectives affirmed by all U.N. member states in September 2015—is to end extreme poverty in all forms by 2030. Now that a year has passed since the establishment of the Goals, it is timely to assess how close each country stands to achieving the objective, defined as universal access to basic human needs. To that end, this policy brief presents current trajectories for 193 countries across a variety of key SDG targets. We focus on indicators with available data that were also previously addressed under the Millennium Development Goals (MDGs) from 2000 through 2015.

Overall, the analysis tackles three questions:

- 1) What is each country's current 2030 trajectory for each target?
- 2) What are each country's current prospects across targets?
- 3) For the most off-track countries and targets, is there a recent precedent for SDG success?

The results build on previous forward-looking assessments of individual targets (FAO, 2015; UNESCO, 2016; You et al., 2015; Alkema et al., 2016) and aggregate global trends (Nicolai et al., 2015). To our knowledge, this is the first systematic attempt to present country-level 2030 trajectories across several extreme poverty-relevant SDG targets. Importantly, it considers countries at all income levels, consistent with the SDGs' emphasis on the universal challenges of sustainable development.

Methods

We focus the analysis on six targets, and seven related indicators, with ample country-level, time-series data:

SDG 2.1	0% undernourishment
SDG 3.1	<70 maternal deaths per 100,000 live births
SDG 3.2	<25 deaths in children under-5 per 1,000 live births & <12 neonatal deaths (first 28 days of life) per 1,000 live births
SDG 4.1	100% primary school completion rate
SDG 6.1	100% access to safe drinking water
SDG 6.2	100% access to sanitation facilities

Data for SDG 3.2 are drawn from the U.N. Inter-agency Group for Child Mortality Estimation (2015) and all other data are drawn from the World Bank's online World Development Indicator database. Country income groups follow the World Bank's classifications as of July 2016.

These indicators represent only a subset of relevant SDG targets and clearly do not permit a comprehensive analysis of all issues relevant to the end of extreme poverty. However, even this subset provides

a surprisingly rich amount of information regarding trajectories linked to extreme poverty. Ideally we would have been able to include more indicators in the analysis, but country-level data gaps do not allow rigorous trend assessment on issues like extreme income poverty or malnutrition (see Serajuddin et al. 2015). Income poverty extrapolations also require assumptions about changes in within-country consumption distributions, which lie beyond the scope of our simple extrapolation methodology (World Bank Group, 2016).¹

To assess 2030 trajectories, we first calculate each country’s average annual rate of progress between 2005 and 2015. We then extrapolate the same trend out to 2030. For maternal mortality, child mortality, and neonatal mortality, we use proportional rate of progress calculations (Equation 1) to account for the ladder of technology countries must climb as mortality rates approach zero. For the other indicators we use percentage point (absolute) rate of change calculations (Equation 2), on the premise that these indicators rely more on expanding access to a relatively consistent technology set, such as water wells, toilets, or staple foods. The distinction aligns with previous literature examining rates of progress during the MDG period (e.g., Kenny and Sumner, 2011; Fukuda-Parr et al., 2013; You et al. 2015).

$$\textit{Proportional rate} = 1 - \left(\frac{N_{2015}}{N_{2005}} \right)^{\frac{1}{10}} \quad (1)$$

$$\textit{Percentage point rate} = \frac{N_{2015} - N_{2005}}{10} \quad (2)$$

For access to water, access to sanitation, and primary school completion rate, minor adjustments are needed to calculate the annualized rate of progress when countries are missing indicator values between 2005 and 2015. If a value is missing for 2005 then we set 2004 as the initial year for rate calculations. If a value is missing for 2015 then the most recent available year from 2010 onward is set as the end point. For undernourishment, the World Bank reports all values below five percent as “<5.” In those cases, since we are not able to calculate annual rates of progress, we make a simplifying assumption that countries are on track to eliminate hunger by 2030 (indicated by “~0” in Table 2 below).

To tabulate how countries are performing across targets, we consider maternal mortality, under-5 mortality, neonatal mortality, access to water, and access to sanitation. We do not include undernourishment and primary completion rates in those tabulations because of data gaps. For maternal mortality, we apply the SDG 3.1 benchmark of 70 deaths per 100,000 live births at the country level, even though the formal target is defined at the global level. For target 3.2, we only count countries as being on track if they are on course to reach both the under-5 mortality target and the neonatal mortality target, since the latter is a subset of the former.

¹ Readers interested in more detailed considerations of policy issues linked to the “last mile” of extreme poverty might wish to read the volume edited by Chandy et al (2015), including McArthur (2015).

Results

What is each country's current 2030 trajectory for each target?

Table 1 shows the number of countries whose current trajectories place them on track to meet each target by 2030. This summarizes the data presented in Table 2, which lists, for each indicator, every country's most recent available data point and current trajectory for 2030. Values at or better than the SDG target are colored green. Values are colored red if a country has shown recent evidence of moving backwards, away from the target. For primary completion rates, some of these backward-trending data might be a result of either short-term negative shocks or challenges of measurement, so in those cases we make an approximating assumption that the 2030 trajectory value is the same as the value for 2015 (or most recent year).

The table indicates that health-related indicators have the largest number of countries on track to reach the 2030 targets: 143 countries are currently on course for child mortality and 130 countries are on course for neonatal mortality. However, 63 countries are not on track to meet both SDG 3.2 benchmarks. Nineteen countries are on course to reach an under-5 mortality rate between 50 and 106 deaths per 1,000 live births, at least twice the target level of 25 deaths per 1,000 births. Somewhat fewer countries, only 111, are on track to achieve a maternal mortality ratio of 70 or lower. Sanitation is the issue with the greatest overall shortcomings, including only 36 countries that are on a path to universal access by 2030. This compares to 89 countries, less than half of U.N. member states, that are on course for universal access to drinking water.

Trajectories for undernourishment and primary completion rates are more ambiguous, but also not nearly positive enough for universal achievement of the relevant SDGs. Twenty-five countries are explicitly on track to end undernourishment by 2030 and another 36 countries are assumed to be on track, for a total of 61 countries listed in the corresponding "Yes" row in Table 1. Meanwhile 79 countries are on course to achieve universal primary completion. But fully 78 countries do not have adequate data to assess undernourishment and 57 lack data for primary completion. Many of the data gaps are in developing countries, where missing values are probably highly correlated with being off track. For the high-income countries that do not report, in the best case this could be because an issue is already deemed to be solved. In the worst case it could be that poverty-related problems of marginalized groups simply receive inadequate attention.

Table 1: Number of countries currently on track, by SDG target

	2.2	3.1	3.2a	3.2b	4.1	6.1	6.2
Meet target by 2030	Under-nourishment	Maternal mortality	Under-5 mortality	Neonatal mortality	Primary completion rate	Access to water	Access to sanitation
Yes	61	111	143	130	79	89	36
No	54	70	49	62	57	96	147
No data, developing countries	31	4	0	0	37	4	4
No data, high-income countries	47	8	1	1	20	4	6
Total	193	193	193	193	193	193	193

What are each countries’ current prospects across targets?

The map in Figure 1 indicates how many of four key SDG targets each country is on track to meet by 2030: maternal mortality; under-5 and neonatal mortality; access to water; and access to sanitation. As mentioned above, we do not include undernourishment or primary school completion here due to data gaps, and we only count countries as meeting target 3.2 if they achieve 2030 thresholds for both under-5 and neonatal mortality.

Figure 1: How many of four key SDG targets are countries on track to meet by 2030?

† Income Groups: H = high-income, M = middle-income, L = low-income

* The World Bank reports all undernourishment values below 5% as "<5". The table assumes countries with this reported value in 2015 reach the SDG target by 2030, as indicated by "-0".

** For countries registering recent backward movement on primary completion rate, 2030 values are assumed to be the same as 2015 values.

Of the 175 countries with adequate data, only 22 are currently on track to meet all four targets. At the other end of the spectrum, the greatest global concern should be the 37 countries that are currently on a path to meet none of the goals. These countries are listed in Box 1. They are roughly evenly split between low-income countries and middle-income countries; the majority (28 countries) are located in sub-Saharan Africa. Not only are these countries off track, they are also some of the furthest in absolute distance from reaching the targets. Meanwhile, another 31 countries are on track for only one of the four targets; 15 of these are also located in sub-Saharan Africa.

Box 1: 37 top priority countries

The following 37 countries are currently not on track to achieve any of the SDG target thresholds for maternal mortality, child mortality, access to water and access to sanitation:

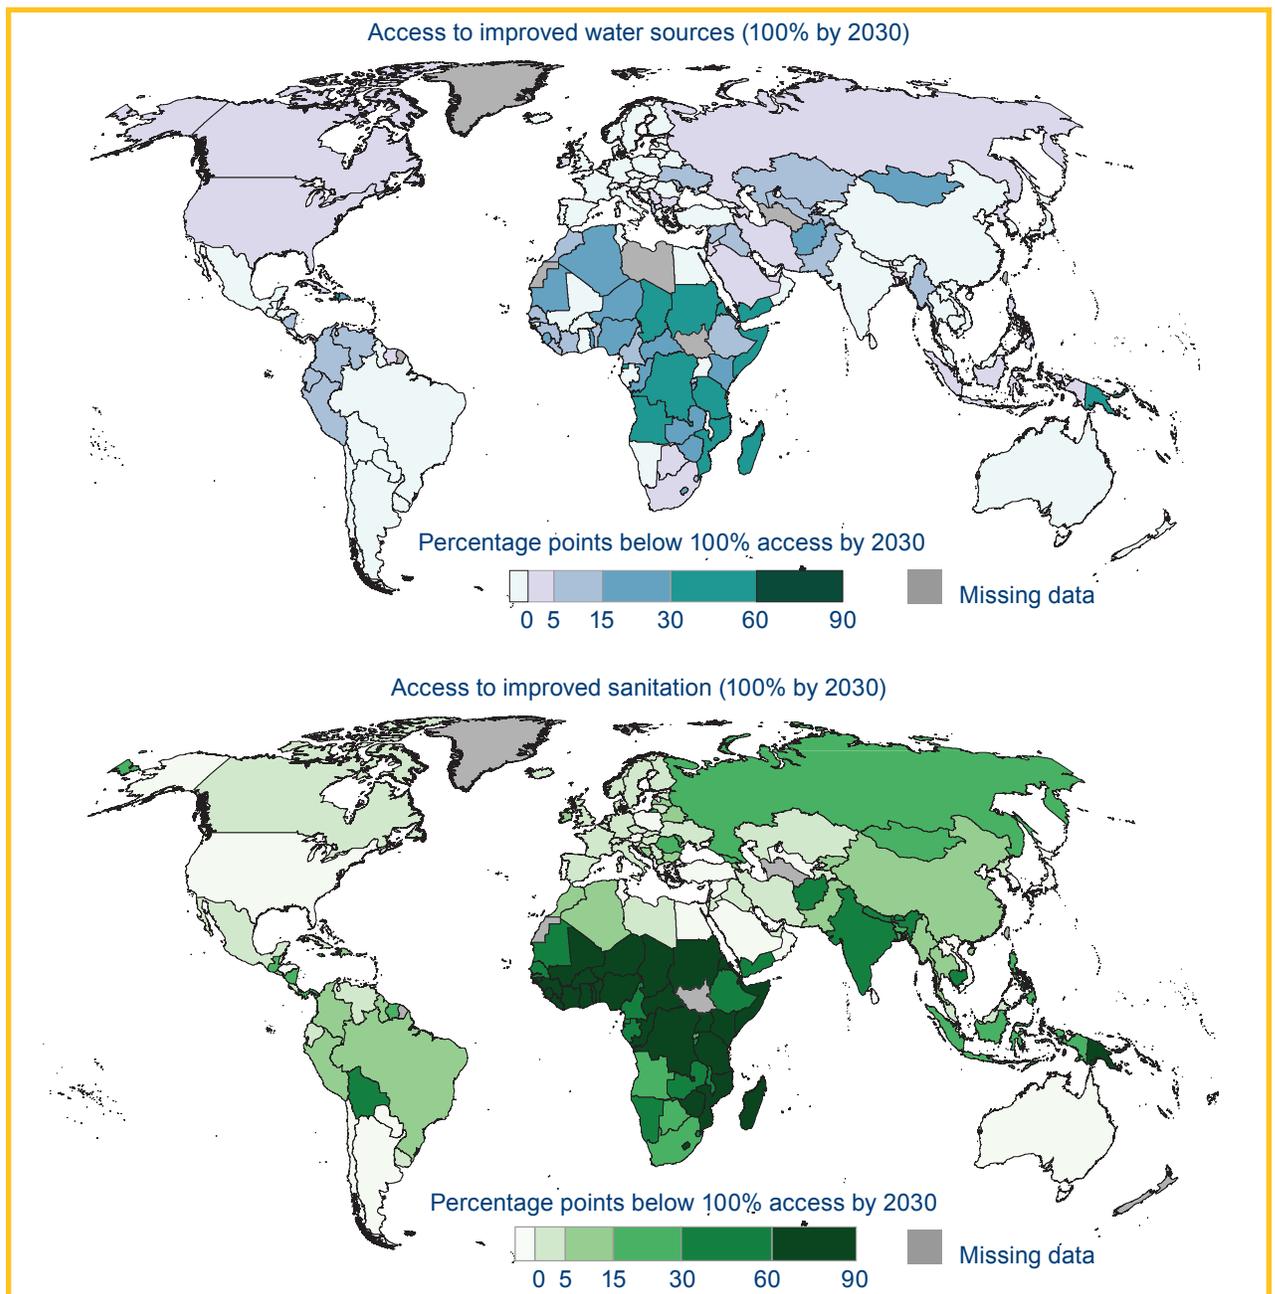

Afghanistan	Comoros	The Gambia	Mozambique	Sudan
Angola	Congo, DR	Guinea	Myanmar	Togo
Bangladesh	Cote d'Ivoire	Haiti	Niger	Yemen
Benin	Djibouti	Kenya	Nigeria	Zambia
Burundi	Dominican Republic	Lesotho	Pakistan	Zimbabwe
Cameroon	Equatorial Guinea	Liberia	Papua New Guinea	
Central African Republic	Eritrea	Madagascar	Sierra Leone	
Chad	Ethiopia	Mauritania	Somalia	

Remarkably, 27 high-income countries are off track for one target and another six (Bahamas, Canada, Ireland, Slovenia, Trinidad and Tobago, and United Arab Emirates) are off track for two targets—the same number of targets, for example, as a low-income country like Uganda. Of course, advanced economies are typically off track for different reasons than lower-income countries. Canada and Ireland, for example, are both close in absolute terms to achieving 100 percent access to drinking water—at 99.8 and 97.9 percent, respectively, in 2015—but they have made slow if any progress in increasing access over the past decade. Meanwhile Uganda reports 79 percent access to drinking water in 2015, but that figure has been improving at an average rate of 1.5 percentage points per year, which puts them on track to reach 100 percent access by 2030. Thus “off-track” status is not intended to suggest equivalent needs across all countries. Instead, it simply highlights the importance of a universal policy framework that aspires to ensure all societies “leave no one behind.”

The commonality of off-track status on access to sanitation underscores the need for careful country-by-country analysis. Twenty-two high-income countries have made zero progress or slightly regressed on this issue over the last 10 years. In comparison, only two of 30 low-income countries and 16 of 85 middle-income countries have made zero progress or are regressing, but many of these countries need to cover a much larger absolute distance to the goal. Uganda, for instance, registered 19.1 percent with access in 2015, on course to 22.6 percent in 2030. Meanwhile Canada has been stagnant at 99.8 percent access for many years, while Ireland has improved only slightly to reach 90.5 percent access as of 2015.

Figure 2 highlights how far off track different countries currently are for both water and sanitation. At one end of the spectrum, 60 countries are on a course to miss the water target by more than 5 percentage points. Meanwhile 99 countries are currently on a path to miss the sanitation target by at least the same increment. Somalia is furthest off course for water, achieving only 42 percent of its population with access by 2030. Togo is furthest behind on sanitation, currently reaching only 12 percent coverage by 2030.

Figure 2: Comparing 2030 trajectories for water and sanitation

For the most off-track countries and targets, is there a recent precedent for SDG success?

The countries furthest off track from SDG success clearly require major accelerations in progress. Table 3 shows recent rates of progress among off-track countries on the five indicators with available data—showing both the average and the range of rates—and then compares this to the rates the same countries require to achieve the target by 2030. It further lists the country with the fastest rate of progress on each indicator from 2005 to 2015, to assess whether that precedent would be adequate for the countries currently furthest off track.

Table 3: Average speed needed for off-track countries to meet the targets by 2030

	Current average speed ~2005–2015	Average speed needed	Recent precedent for furthest behind?	
Maternal mortality (min to max)	2.4% (-3.7% to 7.2%)	9.6%* (0.9% to 17.9%)*	No	Kazakhstan (12.2%)
Under-5 mortality (min to max)	3.2% (-3.1% to 5.8%)	6.9%* (0.6% to 11.5%)*	No	Rwanda (9.3%)
Neonatal mortality (min to max)	2.0% (-3.1% to 4.1%)	5.2% (1.7% to 8.9%)	Yes	Maldives (9.7%)
Access to water (min to max)	0.3 pct. points (-0.4 to 1.9 pct. points)	1.2 pct. points (~0.0 to 4.0 pct. points)	No	Cambodia (2.3 pct. points)
Access to sanitation (min to max)	0.3 pct. points (-0.7 to 1.8 pct. points)	2.2 pct. points (~0.0 to 5.9 pct. points)	No	Lao PDR (2.8 pct. points)

Note: all averages are simple, unweighted averages across off-track countries

**excludes countries that meet target as of 2015 but are on (negative) trajectory to miss target by 2030*

Among the five indicators, neonatal mortality is the only one for which there is a reasonable recent precedent for the country furthest behind to achieve the 2030 target. Specifically, Angola had the highest neonatal mortality rate in 2015, at 49 deaths per 1,000 live births. To meet the SDG threshold by 2030, it needs to accelerate from its recent average declines of 1.4 percent per year to declines of 8.9 percent per year. Pakistan follows close behind, needing an annual rate of 8.5 percent, while the Central African Republic requires a rate of 8.1 percent. Reassuringly, from 2005-2015, China, Estonia, Macedonia, and the Maldives all reached comparable rates of progress.

For the other four indicators, there is no recent precedent for rates of progress that would allow the furthest behind countries to achieve the SDG target. However, each indicator does have an example of at least one country recently progressing at the speed required for the “average” currently off-track country. In other words, all indicators have a precedent for the typical off-track country still to succeed.

Another way to consider required SDG progress is to group off-track countries by how much each one needs to accelerate above their current rate of progress.

- To meet the maternal mortality target, 46 off-track countries need to increase their rate of progress by more than 4 percentage points per year. This includes 26 low-income countries and 20 middle-income countries. Twenty-four countries need to accelerate by 0 to 4 percentage points per year.
- For under-5 child mortality, 20 countries need at least a 4 percentage point annual acceleration, as do 21 countries for neonatal mortality. Twenty-nine countries need to accelerate progress on under-5 mortality by 0 to 4 percentage points per year, while 41 countries require the same range of acceleration for neonatal mortality.
- For water, 13 countries need to accelerate by at least 2 percentage point per year and 83 need to accelerate by 0 to 2 percentage points per year.
- For sanitation, 52 countries need to accelerate by at least 2 percentage point per year, including 29 requiring more than 4 percentage points. Ninety-five countries need to accelerate by between 0 and 2 percentage points per year.
- For undernourishment, data limitations prevent the same type of country tabulations. However, available data indicate that at least four regions will still have undernourishment by 2030: Latin America and the Caribbean, the Middle East and North Africa, South Asia, and sub-Saharan Africa. On current trajectories, sub-Saharan Africa is the furthest from the target by 2030. The region will need to double its current rate of progress from 0.6 to 1.2 percentage points per year. South Asia similarly needs to accelerate its annual rate of progress from 0.5 to 1.1 percentage points annually.
- For primary education, three regions require acceleration. Europe and Central Asia, the Middle East and North Africa require only slightly faster rates of progress. Sub-Saharan Africa's completion rates need to accelerate by 1 percentage point per year.

Conclusion

This policy brief presents a simple extrapolation methodology to help focus attention on the nature of cross-country progress that still needs to be instigated if the world is to have a chance at achieving its stated ambition of eliminating, by 2030, the many forms of extreme poverty. Some of the results unsurprisingly draw attention to low-income countries that still have substantial ground to cover. Other results offer a form of wake-up call for high-income countries that have a smaller relative problem to ad-

dress in meeting basic needs but have been too stagnant in promoting universal access for their citizens. Access to basic sanitation lags behind in more countries than any other issue, but it is far from the only challenge across indicators for health, education, undernutrition, and access to drinking water.

Our results suggest that the world's frontline in the fight to end extreme poverty can be found in 37 countries. These are the places not on track to achieve any of the four key poverty targets with adequate time-series data for assessment. They merit thoughtful prioritization among international cooperation efforts.

Importantly, countries beginning the SDG period from furthest behind will often need to outpace even the best recent cases of progress. The challenge will likely require new forms of policy coordination and delivery in those circumstances. The MDG period provided many forms of previously unexpected breakthroughs, most notably in the realm of global health, so the world needs to “double down” in extrapolating the organizational lessons from those successes.

Current 2030 trajectories also underscore the need for all countries to tackle their extreme poverty challenge. Out of 193 U.N. member states, fully 154 are off track from achieving at least one of the four benchmarks for maternal survival, child survival, access to water, and access to sanitation. This includes 30 low-income countries, 90 middle-income countries, and 33 high-income countries. There can be little question: the SDG challenge is universal.
